

BattleMemory

BattleMemory is the central repository of battle evidence.

Its responsibility is not to determine truth.

Its responsibility is to preserve every meaningful observation made during a battle.

Inference belongs to other systems.

BattleMemory remembers.

Role in the Pipeline

BattleMemory receives observations from the Observation Engine.

It stores evidence.

It provides evidence to downstream systems.

It never performs presentation.

Philosophy

BattleMemory remembers what happened.

It does not decide what happened.

Every observation has value.

Every observation contributes evidence.

Truth emerges from accumulated evidence rather than individual observations.

Core Principles

Preserve Evidence

Observations should never be discarded simply because they appear incorrect.

Conflicting observations reduce confidence.

They do not erase history.

Facts Before Conclusions

BattleMemory records facts.

Inference derives conclusions.

Presentation communicates conclusions.

These responsibilities should never overlap.

Immutable History

Once an observation has been recorded, it becomes part of battle history.

Corrections are recorded as additional observations.

History is never rewritten.

Confidence Evolves

Confidence changes.

History does not.

Additional observations strengthen or weaken confidence without altering previous evidence.

Read-Only Consumers

BattleMemory owns its data.

Other systems may query BattleMemory.

They may never silently modify it.

Responsibilities

BattleMemory:

- Stores observations.
- Stores evidence.
- Stores confidence.
- Stores timestamps.
- Maintains current battle state.
- Supplies information to downstream systems.

BattleMemory does not:

- Perform OCR.
- Infer battle outcomes.
- Recommend actions.
- Archive completed battles.
- Present information to the player.

Relationship to Other Systems

Observation Engine discovers evidence.

BattleMemory preserves evidence.

Inference Engine interprets evidence.

BattleTimeline records battle history.

Overlay communicates conclusions.

Each system owns exactly one responsibility.

Design Goal

BattleMemory should function as the player's second brain.

It should remember everything the player cannot reasonably remember.

It should forget nothing.

It should invent nothing.
