

Overdex Philosophy

Overdex exists to reduce cognitive load without reducing player agency.

It is not designed to play Pokémon GO.

It is designed to help players think more clearly while they play.

Knowledge Before Advice

Advice without understanding is fragile.

Overdex begins with knowledge.

The Pokédex is the foundation because every intelligent recommendation depends upon accurate information.

The application should always know more before attempting to recommend more.

Confidence Over Certainty

Not every conclusion deserves complete confidence.

When confidence is high, Overdex speaks clearly.

When confidence is reduced, Overdex communicates why.

Trust is earned through honesty, not certainty.

Observe Before Inferring

Observation creates facts.

Facts support inference.

Inference produces recommendations.

Presentation communicates recommendations.

Every layer depends on the integrity of the layer beneath it.

The Player Comes First

The player is making the decisions.

Overdex is not.

The application should reduce cognitive load rather than replace player judgment.

Good software assists.

Great software teaches.

Learn Once

Information should become intuition.

If Overdex helps a player make better decisions even when the application is closed, it has succeeded.

The best feature eventually makes itself unnecessary.

Simplicity Wins

Complexity should exist in the engine.

Simplicity should exist in the interface.

The player should experience clarity regardless of how much work happens beneath the surface.

The Game Boy Principle

The original Game Boy succeeded because it focused attention.

Its interface was simple.

Its controls were predictable.

Its purpose was obvious.

Overdex should feel the same way.

Every control should have one responsibility.

Every interaction should feel familiar.

Respect the Player's Attention

Attention is limited.

Every pixel must justify its existence.

Every animation must communicate something meaningful.

Silence is often better than noise.

Build Something Worth Keeping

Technology changes.

Platforms change.

Frameworks change.

Good ideas endure.

Overdex should be built in a way that future versions can improve without abandoning the principles that created them.
